El cost real del menjar barat

Michael Carolan

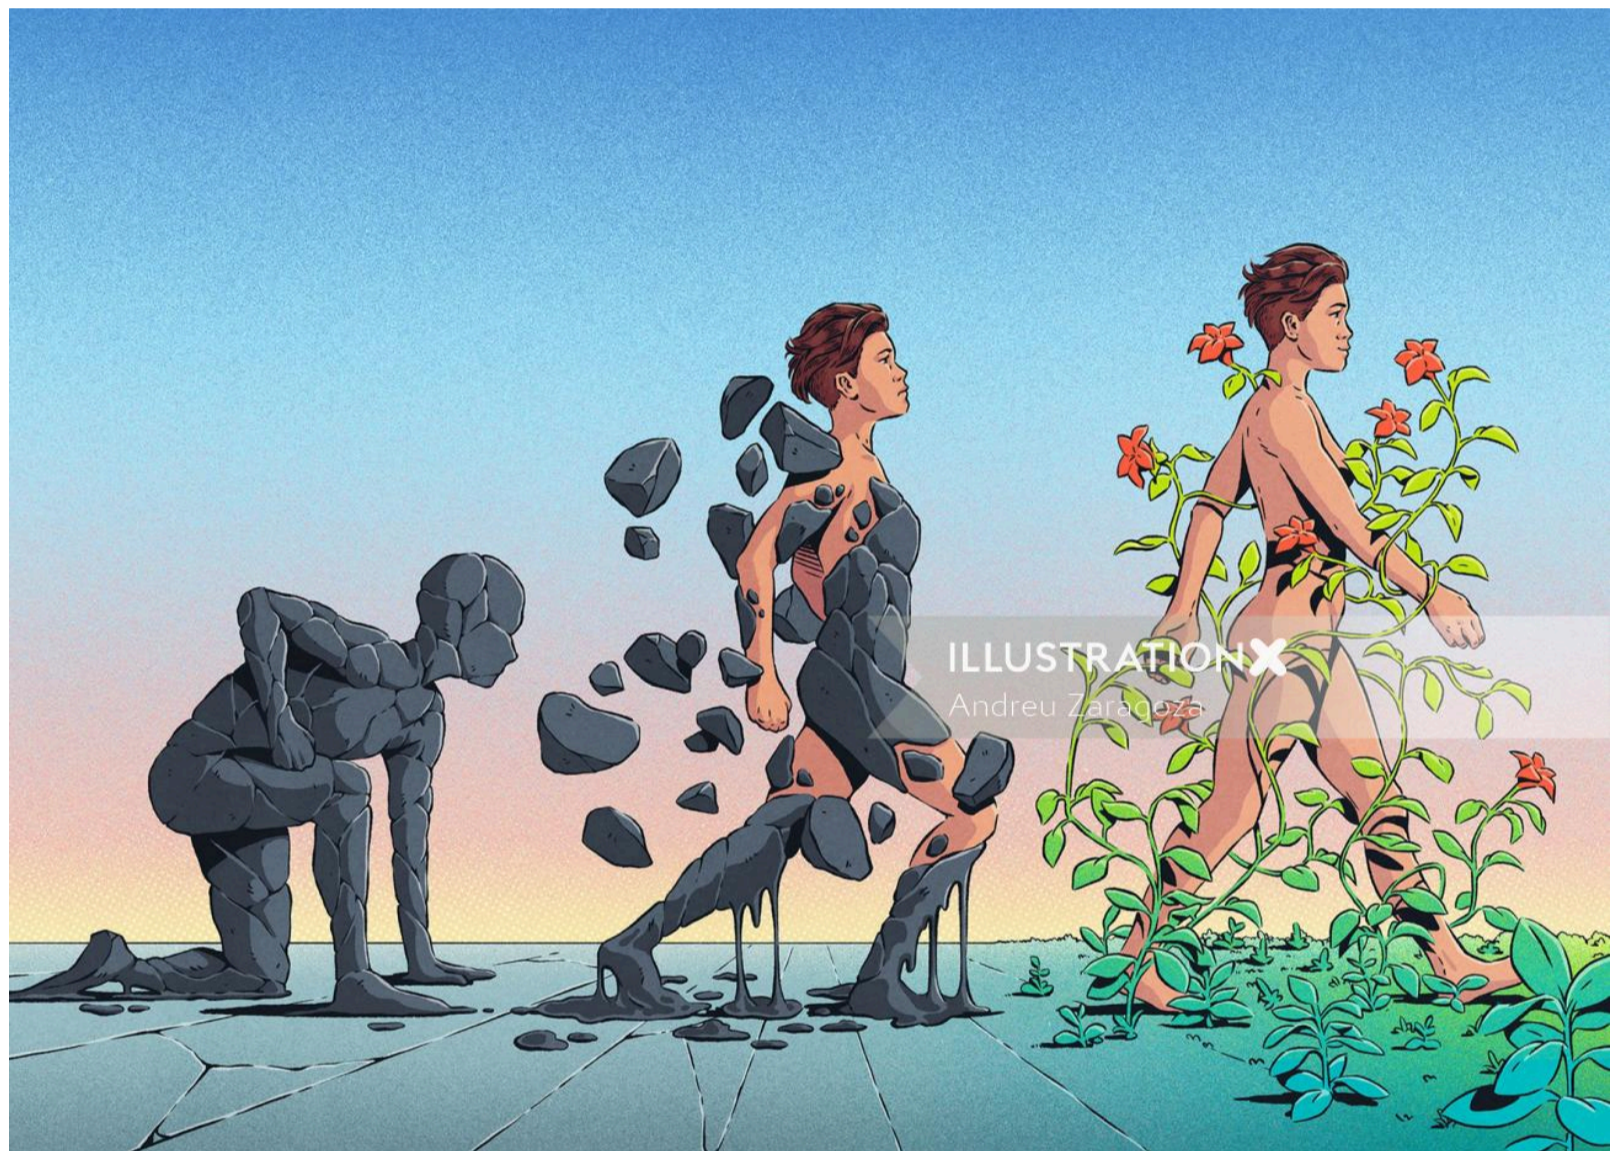

Traducció d'Elena Ordeig

Una revelació del veritable cost social, econòmic
i ecològic del menjar barat que reflecteix les
desigualtats i condiona el nostre futur.

SUPERSTAR GALAXIES!

By Ken Crowell, Ph.D. • Art by XXX

You live in a big galaxy called the Milky Way, which has hundreds of billions of stars. But there are many

MILKY WAY

TYPE: BARRED SPIRAL GALAXY
DISTANCE: YOU'RE IN IT!

The Milky Way is our galaxy. The Sun, Moon, and Earth are all part of it. So is every star you see in the sky. But the Milky Way is so big that what you see is only a tiny bit of it.

Our galaxy is bigger than most others. Its center is 27,000 light-years from Earth. That means light needs 27,000 years to travel from the Milky Way's center to us!

Most stars in the Milky Way, including our Sun, reside in the galaxy's disk. This disk also has gas and dust, which make new stars. Shaped like a big pancake, the disk spins super fast, whipping up spiral arms. At the center is a bar full of bright stars. That's why the Milky Way is a barred spiral galaxy.

LARGE MAGELLANIC CLOUD

DISTANCE FROM EARTH: 160,000 LIGHT-YEARS

The glare of the bright star Regulus can hide Leo I from our view.

LEO I

TYPE: DWARF SPHEROIDAL GALAXY
DISTANCE FROM EARTH: 830,000 LIGHT-YEARS

Leo I is the farthest of the Milky Way's many satellite galaxies. Astronomers discovered it in 1950 in the constellation Leo the Lion. Leo I is what's known as a dwarf

MAGELLANIC CLOUDS

TYPE: IRREGULAR GALAXIES

The Magellanic Clouds are two galaxies that go around the Milky Way. We call them satellite galaxies, because they orbit the Milky Way just as satellites, such as moons, orbit planets.

These galaxies are smaller than the Milky Way and have fewer stars. But they have gas and dust to create new stars.

The Magellanic Clouds are not spiral galaxies like the Milky Way. Instead, we call them "irregular," because they have no
