TheraKey

Angina pectoris

Das Herz, der Motor des Menschen

Das Herz pumpt Blut mit Sauerstoff, Glukose und Nährstoffe durch das Gefäßsystem und versorgt so alle Zellen und Organe. Dafür benötigt das Herz selbst genügend Sauerstoff, um auch bei körperlicher Anstrengung die Pumpleistung anpassen zu können.

Angina pectoris-Beschwerden, wie z. B. Brustschmerzen, Engegefühl und/oder Luftnot, beruhen auf einer Unterversorgung des Herzens mit Sauerstoff (myokardiale Ischämie).

Koronargefäße

Die Versorgung des Herzens wird durch die Herzkranzgefäße übernommen. Sie entspringen aus der Hauptschlagader (Aorta) und verzweigen sich in viele kleine Gefäßäste, die den Herzmuskel wie ein Netz umgeben und mit Blut versorgen. Angina-Beschwerden treten auf, wenn diese Versorgung vorübergehend gestört ist.

Mikrogefäße

Die kleinsten Gefäßstrukturen der Koronargefäße, die Mikrogefäße, entspringen aus den großen Hauptästen der Koronargefäße und versorgen das Gewebe des Herzmuskels bis in die Tiefe.

Gesunde Herzmuskelzellen

Durch die Entspannung der Herzmuskelzellen ist die Perfusion der Mikrogefäße wieder gewährleistet.

Erkrankte Herzmuskelzellen

Dauerhafte Kontraktionen der Herzmuskelzellen führen zu einem Abdrücken der Mikrogefäße. Dies kann Angina pectoris-Beschwerden auslösen.
